Parrot CK3000 EVOLUTION - the discrete and fully integrated *Bluetooth* hands-free system

Phone calls made easy

The CK3000 EVOLUTION is a *Bluetooth* hands-free system: it pairs with and connects to your *Bluetooth* cell phone, smartphone or iPhone for true hands-free calls with your contacts, while you keep your eyes on the road and your hands on the wheel. Thanks to the "Accept" voice command, you can easily and quickly answer any calls. For frequently called contacts, record voiceprints* and use the built-in voice recognition feature to dial in just seconds.

* This function depends on the phone used.

A simple and effective interface

The CK3000 EVOLUTION offers a simple, discrete and intuitive interface: the central button provides access to the menus, the green button launches the voice recognition feature and accepts incoming calls, and the red button hangs up and cancels the current selection. The optimally-sized interface can easily be positioned on your vehicle's dashboard.

Exceptional sound quality

This hands-free system leverages all of Parrot's signal processing expertise. The result is excellent sound quality during calls for both you inside the vehicle and your caller. Combined with a positionable and adjustable microphone, the CK3000 EVOLUTION boasts the very best in noise reduction and echo cancellation technology. The system delivers optimal audio comfort and parasite -free voice quality.

Integrated into the vehicle's audio system

Like other solutions, the CK3000 EVOLUTION connects to your vehicle's audio system between the car stereo** and the speakers. Calls and voice menus are reproduced over the speakers for maximum listening quality. If you are listening to the radio or a CD, the music is automatically muted during calls and then returned after the call.

** Also works without car stereo.

The discrete and fully integrated *Bluetooth* hands-free system

for mobile phone
for PDA
for smartphone
for iPhone

Wireless technology

Bluetooth

The *Bluetooth* wireless technology enables voice and data to be sent via a short-distance radio link. It connects a wide range of electronic equipment without requiring additional cables. Furthermore, it extends the communication possibilities for mobile phones and a large number of devices.
